1)Explain the difference between an event-driven application and a console-based application.
Console baised application: the program controls the order of operations by prompting the user step by step
Event dirven application: the user controls the flow by operating with things like buttems and other things

6)What is the difference between a label and a button?
A label is a static text or image that is only used for displaying information, the user cannot interact with it.
Button is an interactive componet that the user can click to execute a command.

8)List three ways to control the layout of a content pane.
Using layout managers
Nesting panels
Absolute positioning

13)What must first be done with numeric data typed in a text field before it can be used in a calculation?
It must be converted into string

15)An application prompts a user to select a name from a list of six names. Which is a better component choice: a text field or a combo box? Explain.
I think it is a combo box, predefined list(less errors), the user sees all 6 options instead of guessing, the user clicks and it saves, not extra lines of code.
